

Model RedRover/V3 Loadout Data Transfer Software

MS Windows® OS software designed to allow plant data to be exported and transferred to another location from SYSTEMS' DOS-based Loadout computer.

Software Description.....

- Requires a SYSTEMS Equipment Model LC-1000 or Model LC-2000 computer pre-installed with Windows® XP or newer operating system.
- Export databases from the plant database to the following formats: XML file, MS Excel® spreadsheet, comma separated text file, or directly to a printer.
- Exported data can be transferred to any folder location that is available to the computer's file system including, but not limited to: local hard disk drives, USB flash drives, floppy drives, and network shared drives. With VPN hardware or software use, the plant computer could potentially export the data directly to a shared network folder on an office computer in another location miles away.
- Exported data can be sent to one or more email addresses if the Loadout computer has a valid network connection to an email server.
- Filters can be applied to limit which records are exported. For example, any set of tickets may be retrieved based on a date range, a specific job, a specific customer, a specific truck, and/or a specific material.
- The range of tickets chosen may span archived ticket files as well as the current Loadout ticket file.
- Database records can be viewed directly within the program.
- Database columns can be renamed and even omitted all together when exporting.
- Database records cannot be modified or imported back into the database so the system remains "Legal For Trade" certified.
- Each RedRover 3 license is for one (1) plant Loadout computer only.
